

2014

**IMPROVING COMMUNITY
RESPONSE TO WILDFIRE:
2013 FIRE SEASON FINDINGS
REPORT**

VINEGAR FIRE

In 2013, the Fire Chasers Research Team at North Carolina State University developed a series of incident performance measures in collaboration with incident response and land management professionals. The goal of this effort was to provide metrics that can help improve interagency coordination and communication during complex, large scale wildfires. In the summer of 2013, data on these incident response outcomes were collected from 22 Type I and Type II wildland-urban interface fires in Idaho, Montana, Oregon, and Washington. This report summarizes the findings from the Vinegar Fire in the areas of interagency network performance, incident management team performance, use of social media and incident learning and capacity building.

This report was prepared by

North Carolina State University's Fire Chasers Research Team:

Branda Nowell, Ph.D. (Principal Investigator)

Toddi Steelman, Ph.D. (Principal Investigator)

AJ Faas, Ph.D. • Anne-Lise K. Velez, MPA • Joy Davis, BA •

Clare FitzGerald, MPA • Mary Clare Hano, MPH

Vinegar Fire: Incident Report

Study Background

This report summarizes findings on incident response outcomes for the Vinegar Fire that occurred in 2013. The report presents outcomes of the Vinegar Fire compared to twenty-one other Type I and Type II incidents that occurred in Idaho, Montana, Oregon, Washington, and one pilot incident in Colorado, during the 2013 wildfire season. The goal of this report is to provide disaster, fire response, and land management agencies with feedback on the incident. This feedback is designed to help identify areas of strength, as well as prioritize areas for capacity building to improve incident response in the upcoming fire season. This report summarizes findings on the following areas: 1) interagency network performance; 2) incident management team performance; 3) use of social media; and 4) incident learning and capacity building. All findings are based on surveys completed by key personnel associated with the incident management team, host agency, and cooperating disaster response agencies on each incident. County and municipal elected officials in the affected area were also surveyed. Surveys were generally collected from Type I/Type II incident management team members immediately before they transitioned off the incident. Surveys with host agencies and county disaster response agencies were collected in October/ November of 2013. A total of 30 surveys were completed for the Vinegar Fire (65 percent response rate).

How Should I Interpret the Data in This Report?

Incidents differ in their complexity and more complex incidents can create more challenges. The information contained in this report is based solely on the survey data and indicators *do not* account for differences between incidents. This should be kept in mind when interpreting findings from a single incident in relation to the regional incident averages. Findings with lower response rates should also be interpreted with greater caution as there may be key perspectives that are missing. Recommended questions for reflection in interpreting the findings from this report include:

In what areas did we excel during this incident? What strategies and actions did we take that may have contributed to this success? What actions can we take to make sure these practices and lessons are retained for future incidents?

In what areas were our ratings comparatively less positive? How do we make sense of those? Were there missed opportunities either *before* or *during* the incident that might have improved our outcomes in this area? Are there actions we can take *now* to help ensure future success in this area?

Overview: A brief summary of the Vinegar Fire

On August 12th, 2013, a lightning strike started the Vinegar Fire on the Umatilla National Forest, southwest of Granite, Oregon, near the North Fork John Day Wilderness. Umatilla National Forest had a joint delegation of authority with Wallowa-Whitman National Forest, Oregon Department of Forestry, and Malheur National Forest, although the fire never burned onto Malheur lands. Watts' Type II Incident Management Team (IMT) was assigned to the fire before transitioning to Fillis' Type II IMT, and then to Severs' Type III IMT.

Values at risk on the Vinegar Fire included: the community of Greenhorn; natural resources in the North Fork John Day Wilderness; heritage and recreational resources, including trail systems; historical structures; and infrastructure, including Lon Krise Cabin, Ben Camp, Ben Harrison Trail Head, and numerous mining claims. Road closures were ordered on Forest Service Roads. At the height of the incident, 20 residences, a commercial property, and 70 outbuildings were threatened, though according to 209 Incident Reports, no structures were lost and evacuations did not take place.

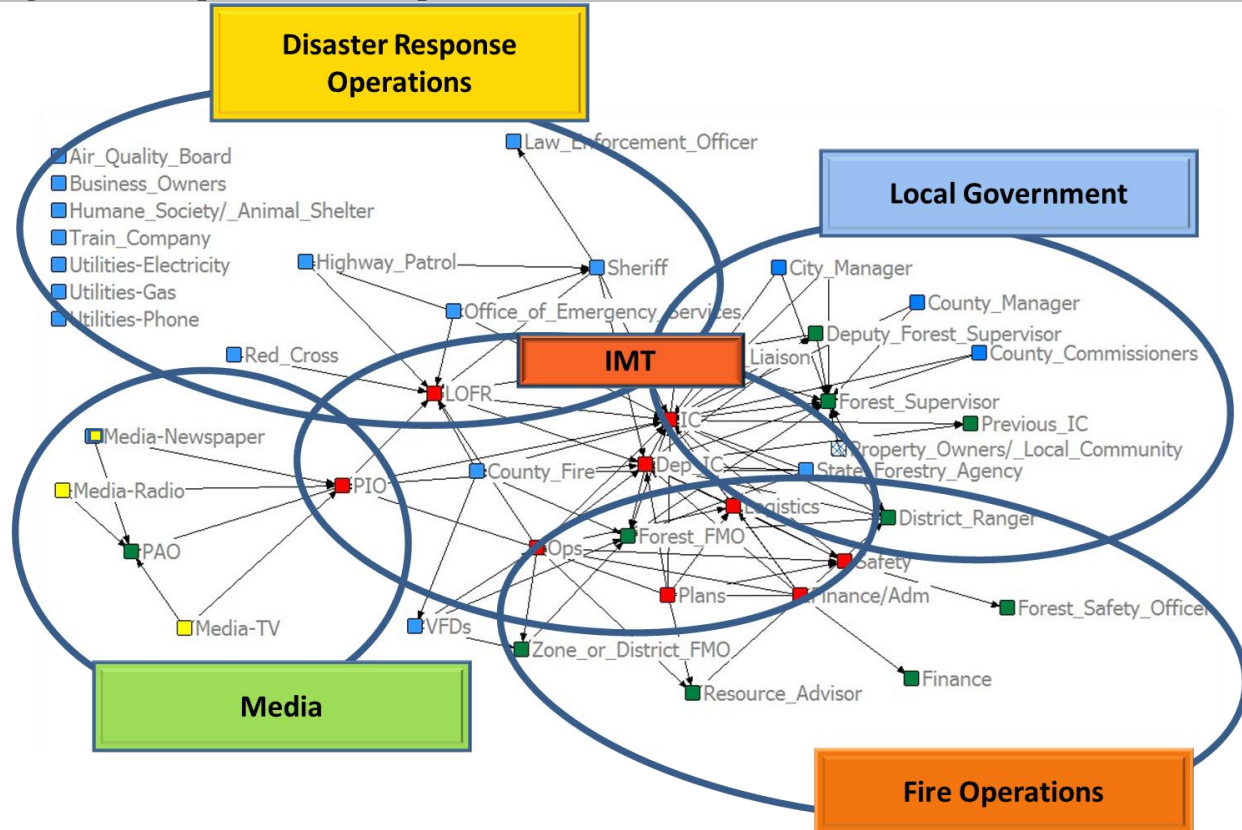

Over 20 representatives from Wallowa-Whitman National Forest Supervisor's Office, Umatilla National Forest Supervisor's Office, North Fork John Day Ranger District, and Malheur National Forest Supervisor's office were present during response to the Vinegar Fire. Both Grant and Baker counties were involved. Local cooperating agencies on the fire included Baker County Emergency Management, Baker County Board of Commissioners, Grant County Sheriff's Office, Baker County Sheriff's Office, Granite City Fire Department, and Grant County Commissioners Office. According to Inciweb, the fire burned close to 1400 acres overall.

Incident Response Network Performance: Vinegar Fire

What Is an Incident Response Network?

Effective incident response to a complex wildfire event involves the coordination of multiple organizations and agencies with formal response responsibilities during the incident. This group of organizations and agencies can be referred to as the *incident response network*. This network typically includes the incident management team, fire management operations, disaster management operations, county and municipal government, and the media. Diagram 1 shows what this network might look like.

Diagram 1. Sample Incident Response Network

What is network performance?

When working as part of an inter-connected network like the one shown in Diagram 1, the actions of any one agency within the network can affect others in the network. Consequently, incident outcomes are often the result of the *combined* management actions of the entire network, and the level of communication and coordination within it. Not all agencies are involved in all areas of incident response. However, problems in one area of the network can lead to problems in other areas. As a result, effective incident response is not about the performance of any single organization or agency, but is related to the performance of the *network as a whole* in the following areas:

- ❖ Interagency coordination & response
- ❖ Public information
- ❖ Road closures
- ❖ Evacuation and re-entry
- ❖ Sheltering & mass care
- ❖ Cost share

To learn more about network performance, we asked all agency and organizational leaders in the incident response network to rate how things went in each of these six areas. Respondents were asked their level of agreement with a set of statements. Options ranged from (1) “strongly disagree” to (5) “strongly agree.” Overall, network performance scores were high. Some areas are also worthy of additional attention prior to this coming fire season. For the twenty-two fires in our sample, overall network performance was the highest for interagency coordination and fire response (average = 4.44) and public information (4.34). On average, lower performance ratings were provided for cost share (3.87), evacuation (3.99), and sheltering/mass care (4.0). See Appendix A for specific questions asked in each category and average level of agreement for each.

Network Performance: How did things go on the Vinegar Fire?

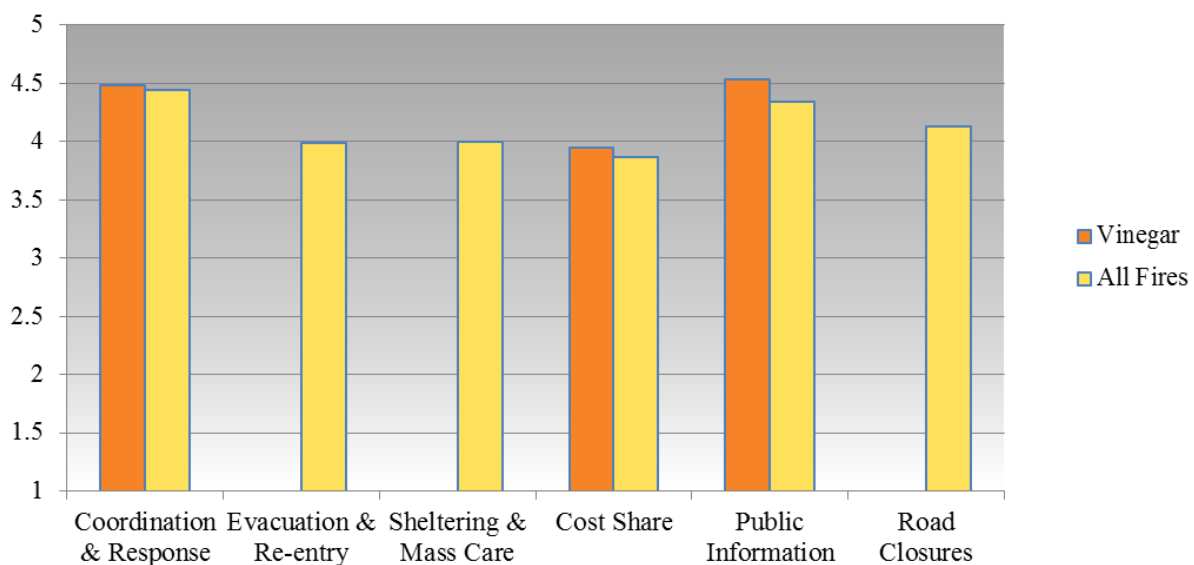

Figure 1 shows network performance ratings for the Vinegar Fire in comparison with the average across all twenty-two fires in our sample. Vinegar Fire network performance was relatively consistent with the averages across all fires for coordination and fire response and cost share. Network performance was above average in the area of public information. Network performance was slightly above average in the area of coordination and fire response and cost share. While still slightly above average in comparison to the region, cost share was identified as the area with the most room for improvement on the Vinegar Fire. In particular, respondents saw more room for improvement in the use of pre-agreed frameworks and principles to expedite cost share agreements.

According to respondents and official reports on this incident, there were no evacuations and re-entry, sheltering and mass care, or road closure issues on the Vinegar Fire, so we do not have data on these network performance factors for this incident.

KEY FINDINGS

- Network performance on Rock Creek was greater than the 22 incident average on 3 of 3 categories relevant on this fire
- Public information was an area of particular success on the Vinegar Fire
- Respondents noted relatively greater room for improvement in developing frameworks for cost share

Figure 1. Average Network Performance by Activity: Vinegar Fire

Incident Management Team Performance: Perspectives from host agencies and local cooperators

On each incident, we asked representatives of local cooperating agencies, the Forest Service, and other host agencies to reflect on how well the incident management team communicated and coordinated with local host agencies and cooperators. Incident management teams (IMTs) were assessed across 19 areas outlined in Table 1 on the following page. The response options ranged from “No room for improvement” to “A lot of room for improvement”, and included “Don’t know” and “Not applicable” choices.

Across all twenty-two incidents, incident management teams were reported to perform the best in: 1) being accessible; 2) acknowledging cooperation; 3) sharing credit; and 4) serving as positive ambassadors in interactions with the local community. On average, scores were quite positive across all areas. However, host communities reported the greatest room for improvement for IMTs in the areas of: 1) obtaining local context information to inform fire operations; 2) incorporating information about local values at risk into fire management plans; and 3) engaging affected jurisdictions in planning and decision making from the beginning. The first column of Table 1 lists the average room for improvement for incident management teams across all fires. The second column displays average room for improvement for the Vinegar Fire incident management team. For each item in Table 1, **lower numbers indicate less room for improvement.**

Average responses for Watts’ Type II IMT on the Vinegar Fire ranged from 0.3 to 1.6 indicating a little to some for improvement. The team was rated more positively than the regional average in 18 of 19 areas during the Vinegar Fire.

Watts’ Type II IMT was rated as demonstrating particular strengths in serving as a positive ambassador in interactions with the local community, acknowledging cooperation, being accessible to host agencies and cooperators, and sharing credit with local agencies. On average, respondents reported “a little” to “some” room for improvement in the Teams’ work incorporating information on local values at risk into the fire management strategy. Other areas the team may want to prioritize as areas for continued improvement include efforts to 1) get local agencies the information they need, 2) be sensitive to local culture/politics, and 3) obtain local context information to inform operations.

KEY FINDINGS

- On average, Watts’ Type II IMT was rated more positively than the regional average in 18 out of 19 areas during the Vinegar Fire
- IMT strengths:
 - serving as a positive ambassador in interactions with the local community
 - acknowledging cooperation
 - being accessible
 - sharing credit with local agencies
- Respondents reported between a little to some room for improvement in the IMT’s efforts at incorporating information on local values at risk into the fire management strategy

TABLE 1. Vinegar Fire Incident Management Team Room for Improvement

Area for improvement in working with Host Unit(s) and local cooperators	22 Incident Average Room for Improvement (0-4)	Vinegar Fire Average Room for Improvement (0-4)
Serving as a positive ambassador in interactions with the local community	1	0.3
Acknowledging cooperation	1	0.4
Being accessible to you	1	0.6
Sharing credit with your agency	1	0.6
Seeking to understand organizational culture, values, and capacities of your agency	1.2	0.7
Being flexible in adapting their fire management strategy to account for local preferences	1.2	0.7
Being helpful to cooperating agencies	1.1	0.7
Using the incident as a training opportunity to build local capacity	1.2	0.7
Rapidly identifying key local players they needed to be communicating with during the incident	1.2	0.8
Including your agency in the dissemination of vital information during the incident	1.2	0.8
Valuing your agency’s input	1.2	0.8
Clarifying roles and responsibilities	1.2	0.9
Engaging affected jurisdictions in planning and decision making from the beginning	1.3	0.9
Staying in their lane and not over-stepping their delegation of authority	1	0.9
Valuing local knowledge and local input	1.2	0.9
Obtaining local context (e.g., burn scars, trail systems, local weather patterns) to inform their operations	1.3	1.1
Being sensitive to local community culture and political climate	1.25	1.1
Getting your agency information you needed to be effective	1.2	1.1
Incorporating information about local values at risk (e.g., biological, archeological, cultural, recreational) into the management of the fire	1.3	1.6

Twitter Use

Social networking sites, such as Twitter, have become important tools for sharing information during various emergencies. Researchers are only beginning to study the implications of social media for risk communication and practitioners are often interested in best practices for using social media. As part of our survey, we asked local cooperators and Forest Service personnel whether they knew of an “official” Twitter feed associated with the wildfire incident, whether they subscribed to this feed, and whether or not they found the information on Twitter helpful. Figure 2 shows percentage of Twitter use for Vinegar compared to the average rate across twenty-one fires in our sample that reported on social media.

Figure 2. Percent Social Media Use and Utility on the Vinegar Fire

Inciweb, personnel from the Umatilla and Wallowa-Whitman National Forests, and a handful of engaged, but unofficial fire watchers all tweeted information about the Vinegar Fire. On the incident, more respondents had knowledge of Twitter than across other fires, but there were a lower percentage of subscribers. Respondents from the Vinegar Fire were more likely to find Twitter helpful, relative to the average across the twenty-one fires in our sample.

KEY FINDINGS

- Vinegar Fire respondents were more aware of Twitter information resources than respondents across other incidents
- Vinegar Fire respondents subscribed to Twitter information feeds with less frequency than respondents across other incidents
- Vinegar Fire respondents found Twitter information sources more helpful than did respondents across other incidents

Moving Forward: Incident learning and capacity building

The field of incident response prioritizes using every incident as an opportunity for learning and relationship building to improve capacity for responding to future events. To assess incident learning and capacity building, respondents were asked to report how personal outcomes were influenced by the incident in the areas of: 1) increased knowledge of other agencies' missions and values; 2) enhanced knowledge of the Incident Command System (ICS); and 3) increased familiarity and strengthened professional relationships within the local network. Respondents were asked to rate how each factor was affected by the incident, on a scale ranging from (1) "much worse" to (5) "much better," with (3) indicating "no change." See Appendix B for specific questions asked in each category and average level of agreement for each.

KEY FINDINGS

- Across all the wildfire incidents we studied, findings indicate that knowledge of agency missions and values, ICS knowledge, and professional relationships were perceived to have improved a little
- Incident learning and capacity building outcomes on the Vinegar Fire were modest
- Some of the more positive outcomes of the Vinegar fire were reported to be an increased knowledge of the county and improved working relationships within the community

Figure 3. Incident Learning and Capacity Building from the Vinegar Fire

Across all the wildfire incidents we studied, evidence suggests that knowledge of other agency missions and values, ICS knowledge, and professional relationships were perceived to have improved. Across all incidents, local cooperators and host agencies reported the greatest improvements in the area of professional relationships, which included respondents reporting strengthened professional relationships with leaders of cooperating agencies,

stronger relationships within counties, and better knowledge of the missions and values of cooperating agencies. The least improvement was shown in local cooperator and host agency knowledge of agency missions and values, which included knowledge of the mission and values of state land management agencies and the National Forest. In the middle range is knowledge of the Incident Command System, which includes familiarity with ICS, opportunities to gain additional training in an area of incident response, and understanding how to work with an IMT, including what the IMT can and cannot do to assist your county during an incident.

On the Vinegar Fire, responses varied between "no change" and "somewhat better" for knowledge of agency missions and values, ICS knowledge, and professional relationships. While reported improvements in incident learning and capacity building were modest on the Vinegar Fire, in no cases did respondents indicate negative impacts. Increased knowledge of the county and improved working relationships within the community were reported as some of the more positive outcomes of the Vinegar fire.

APPENDIX A. Network Performance: Vinegar Fire

Areas of Network Performance	22 Incident Average Level of Agreement (1-5)	Vinegar Fire Average Level of Agreement (1-5)
Coordination & Response		
A coordinated set of fire management objectives were agreed upon among all affected jurisdictions	4.29	4.30
All concerned jurisdictions prioritized maintaining good communication across agencies	4.21	4.26
Credit for success and effort was shared among agencies during public meetings and media events	4.37	4.71
There was a general willingness across agencies to offer assistance to other agencies or jurisdictions	4.48	4.75
“Borrowed resources” were released in a timely fashion to minimize burden on the lending agency	4.38	4.53
Community values at risk from wildfire were readily identified	4.64	4.77
Efforts to protect community values were appropriate given available resources and risks to firefighter safety	4.59	4.30
The overall strategy taken in managing this fire was appropriate	4.40	4.24
Local resources were incorporated into the incident management operations	4.50	4.68
Evacuation Performance		
Cooperating agencies were able to use existing evacuation plans to quickly establish a coordinated evacuation strategy	3.82	NA
Residents received timely notification of evacuation status using clear, pre-established language to distinguish between an evacuation warning and an evacuation notice	4.03	NA
Evacuations were executed in a timely and orderly fashion	4.15	NA
Cooperating agencies had a prepared plan for how re-entry into evacuated areas would be coordinated	4.05	NA
Trigger points for when evacuated areas would be opened for re-entry were clearly communicated to the public	3.88	NA
Re-entry was carried out in an organized and orderly fashion	4.15	NA
Sheltering & Mass Care		
Adequate sheltering options were prepared to house evacuees	4.16	NA
Sheltering options were clearly communicated to evacuees	4.01	NA
Donations for evacuees were well-coordinated	3.74	NA
Auxiliary care needs of evacuees (e.g., food, water, clothing, transportation, spiritual or mental health assistance) were adequately provided for	4.05	NA
Adequate sheltering options were made available to evacuate pets and livestock	3.88	NA
Cost Share Performance		
We used pre-agreed frameworks/principles to expedite cost share agreements	3.80	3.43
The process through which cost share was decided upon was fair	3.86	4.14

The resulting cost share agreement was fair

3.96

4.29

APPENDIX A. Network Performance: Vinegar Fire (continued)

Areas of Network Performance	22 Incident Average Level of Agreement (1-5)	Vinegar Fire Average Level of Agreement (1-5)
Public Information Performance		
Public information was coordinated among cooperating agencies to ensure continuity of the message	4.35	4.50
Local resources were leveraged to ensure timely dissemination of public information	4.32	4.50
Social media was used effectively to provide timely public updates concerning the status of the fire	4.16	4.38
A system for communication with the media was put in place to ensure timely dissemination of public information	4.42	4.69
Road Closure Performance		
All cooperating and fire management agencies maintained a timely awareness of the status of road closures	4.25	NA
Trigger points for making decisions about road closures were proactively communicated to the local community	4.05	NA
A consistent message was provided to the public about the status of road closures	4.11	NA

APPENDIX B. Incident Learning and Capacity Building: Vinegar Fire

Areas of Incident Learning and Capacity Building	22 Incident Average Reported Impact (1-5)	Vinegar Fire Reported Impact (1-5)
Knowledge of Agency Mission & Values		
Your understanding of the mission and values of state land management agencies (e.g., Oregon State Forestry, DNR/DNRC, Idaho Department of Lands, Fire/Timber Protective Associations, etc.) in your area	3.43	3.37
Your understanding of the mission and values of federal land management agencies (e.g., BLM, National Park Service, USFS, etc.) in your area	3.38	3.21
Knowledge of ICS		
Your understanding of what an Incident Management Team can and cannot do to assist your county during an incident	3.44	3.37
Your familiarity with Incident Command Systems	3.48	3.58
Your knowledge of how to work effectively with an Incident Management Team	3.67	3.68
Opportunities for you to gain additional training in an area of incident response	3.45	3.68
Professional Relationships and Networks		
The strength of working relationships within your county	3.76	3.80
The strength of working relationships between your county the local National Forest District	3.60	3.38
The strength of working relationships with National Forest Headquarters	3.42	3.22
Your knowledge of the capabilities and constraints of cooperating agencies in your area	3.73	3.56
Your knowledge of the capabilities and constraints of the local National Forest	3.58	3.40
Your professional networks with leaders of cooperating agencies in your area	3.89	3.68
Your knowledge of your local community	3.72	3.79
